

CLOSEBY PRODUCT STORY

NOT ANOTHER DELIVERY APP

How a buyer and a shop owner actually experience CloseBy once AI is doing the busywork — and why that isn't the same app as the one already on your home screen.

**THE AI DOES THE TYPING.
THE SHOP AND THE SHOPPER
STILL MAKE EVERY CALL.**

TWO PEOPLE, ONE PROMISE

CloseBy connects a buyer to the real shops already near them — not a warehouse styled to look like one. AI sits between both sides of that counter, doing the typing and the reading so people can do the deciding.

SHOPPER

For the buyer

- Say what you need, in your own words, in Hindi, Hinglish or English.
- AI turns that into a cart from real, live stock at a real nearby shop — not a guess, not a substitute picked for you after the fact.
- You still see the cart, edit it, and confirm it before anything is ordered.

OWNER

For the shop owner

- Add 30 products in three minutes with a shelf photo instead of thirty forms.
- New orders get read, checked against stock and hours, and handed back with an accept/reject suggestion and a reason.
- You still tap Confirm — the AI never touches your orders or your shop directly.

GETTING IN, FINDING WHAT YOU NEED

- 1 **Sign up in under a minute** — Name, email, phone — one 6-digit code emailed to you, entered as six boxes that auto-submit. No password to invent or remember.
- 2 **Land on shops actually near you** — Distance comes from your real location, not a delivery-zone map drawn by someone else.
- 3 **Search however you'd actually say it** — “Chawal” finds rice as well as “rice” does — aliases plus AI normalise Hindi, Hinglish and English the same way.
- 4 **See real stock, not a promise** — If a shop shows 4 left, that's what's on the shelf right now — the same number the owner sees.

THE DIFFERENCE

**A big-app search shows you what a warehouse has.
CloseBy's search shows you what the shop three
streets away has, today.**

FROM A SENTENCE TO A DOORSTEP

- 1 **Type one sentence** — “Dal chawal for 4” is enough — AI reads items and amounts the way a person would, with basic food knowledge built in.
- 2 **Get a cart, not a chatbot reply** — Ranked by stock, price and distance; anything out of stock arrives with a suggested swap, not a dead end.
- 3 **Edit anything, then confirm** — The cart is yours to change. Confirming runs the exact same placeOrder as always — price and stock are re-checked, never just trusted.
- 4 **Watch it happen in real time** — Placed, accepted, preparing, ready — updates land the moment the owner acts, with a toast and a sound, even if you're on another tab.
- 5 **Reorder “my usual” in one tap** — Built from your own order history — no typing, no AI needed for the easy case.

STILL YOURS TO DECIDE

The AI never places the order. It hands you a cart; you hand it to the shop. Every rupee is checked server-side either way.

OPENING A SHOP WITHOUT THE PAPERWORK

- 1 **Register with the essentials** — Name, email, phone and shop name — verify with the same fast, boxed OTP a buyer uses, then land straight in shop setup.
- 2 **Add stock with a photo or your voice** — Snap the shelf, or just say it — “rice 5kg 60, dal 120” — and AI drafts names, units, prices and quantities.
- 3 **Check the draft, not retype it** — An editable table comes back with unsure rows in yellow. Fix what's wrong, confirm the rest — it saves through the exact same path as a JSON/CSV import.
- 4 **Go live when you're ready** — A shop starts as a draft and only a deliberate publish step makes it visible to buyers — never automatic.

THIRTY ITEMS, THREE MINUTES

That's the target for the photo-to-stock-list flow — measured, not assumed, before it's called finished.

RUNNING THE COUNTER, HANDS FREE-ISH

- 1 **Hear it the second it lands** — A new order rings out and shows a notification even if you're on another tab, another app, or your screen is off.
- 2 **Get a second opinion, not a decision** — AI reads the order against your live stock, hours and the buyer's history, and suggests Accept or Reject with a reason and a confidence score.
- 3 **You still tap Confirm** — The suggestion is a card, not an autopilot. Confirming calls the same transitionOrder that's always run your orders.
- 4 **See where the week is heading** — Low stock plus sales history become a restock-and-price ideas list — ideas only; price never moves without your yes.

KILL SWITCH, ALWAYS IN REACH

Every one of these helpers has an off switch in shop settings. Turn any of them off and the manual screens work exactly as before.

WHY THIS ISN'T THAT OTHER APP

Quick-commerce apps automate the warehouse. WhatsApp ordering automates nothing. CloseBy automates the typing on both sides of a real, local shop — and stops there on purpose.

Real shops, real stock

- You're buying from an actual nearby shop with its own owner and its own shelf — not a dark store styled to look local.

AI drafts, a human decides

- Every AI action is a suggestion with a confidence score. Nothing changes a price, a stock count or an order status without a tap.

Speaks Hindi/Hinglish first

- Not an English app with a translated menu bolted on — search and the sentence-to-cart flow are built for how people actually type.

No dark patterns

- Stock and price are what the shop actually has — AI is never used to manufacture urgency or hide availability.

A kill switch on everything

- Every helper can be switched off per shop or globally; the app works exactly as well with AI off as with it on.

Built for one phone, patchy signal

- Thirty items in three minutes, not an enterprise dashboard — designed around the owner's actual counter, not a back office.

CLOSEBY VS. THE USUAL OPTIONS

The same nine questions, answered honestly for the three ways people already do this today.

	CloseBy	Quick-Commerce Apps	WhatsApp / Manual
Real nearby shop (not a dark store)	✓	✗	✓
Real-time, truthful stock	✓	—	✗
Understands Hindi / Hinglish	✓	—	✓
AI assists search & ordering	✓	—	✗
Every AI action needs human OK	✓	—	—
Owner can switch AI off	✓	—	—
Live order status updates	✓	✓	—
New-order alerts, even off-tab	✓	✓	—
No manual re-typing by the shop	✓	✓	✗

— means “sometimes / depends on the shop or group” rather than a flat yes or no.

SO, WHAT IS CLOSEBY?

Put the two journeys and the comparison together, and it comes down to one sentence:

A LOCAL SHOP APP WHERE THE AI DOES THE TYPING — AND THE SHOP AND THE SHOPPER STILL DECIDE.

For the buyer

- Less typing, less browsing, the same real shop stock and the same final say over the cart.

For the shop owner

- Less form-filling, faster stock, a second opinion on every order — and a kill switch within reach at all times.
